The FACE Technical Standard is developed by The Open Group FACE Consortium, a collaborative partnership between industry, government and academia. It is a vendor-neutral approach for addressing the affordability initiatives of the military aviation community. It is designed to enhance the U.S. military aviation community's ability to address issues of limited software reuse and increase warfighter capabilities, as well as enable the community to take advantage of new technologies more rapidly and affordably. For more information regarding the FACE approach, please visit: <https://www.opengroup.org/face>
